

# Statistics and data analysis I

## Week 9

“Random variable(1): Random variable, distribution, expected value and variance”

**2018.12<sup>th</sup> June**

**Hirotsada Honda**

# Lecture plan

Week1: Introduction of the course and some mathematical preliminaries

Week2: Overview of statistics, One dimensional data(1): frequency and histogram

Week3: One dimensional data(2): basic statistical measures

Week4: Two dimensional data(1): scatter plot and contingency table

Week5: Two dimensional data(2): correlation coefficients, simple linear regression and concepts of Probability /

Probability(1): randomness and probability, sample space and probabilistic events

Week6: Probability(2): definition of probability, additive theorem, conditional probability and independency

Week7: Review and exam(i)

Week8: Random variable(1): random variable and expectation

Week9: Random variable(2): Chebyshev's inequality, Probability distribution(1): binomial and Poisson distributions

Week10: Probability distribution(2): normal and exponential distributions

Week11: Review and exam(ii)

Week12: From descriptive statistics to inferential statistics -z-table and confidence interval-

Week13: Hypothesis test(1) -Introduction, and distributions of test statistic (t-distribution)-

Week14: Hypothesis test(2) -Test for mean-

Week15: Hypothesis test(3) -Test for difference of mean-

Week16: Review and exam(3)

※ Might be changed!

## 2. Topics of this week

# Agenda

- Random variable
  - Discrete random variable and its distribution
  - Continuous random variable and its distribution
  - Cumulative distribution
- Expected value and variance
  - Expected value
  - Variance and standard deviation
  - Normalization

## 2-1. Random variable and distribution

# Random variable and distribution

- **Random variable** (R.V.) is a number whose values are determined according to a certain probability
- **Probability distribution** is a relationship between numbers of a random variable and the corresponding probability.

# Probability distribution of discrete random variables

- In case the values of a random variable is discrete (integer, for instance), its distribution is shown by a table below.

R.V. $X$	$x_1$	$x_2$	$x_3$	...	$x_n$
Probability	$p_1$	$p_2$	$p_3$	...	$p_n$
➤ $P(X = x_i) = p_i$					

➤  $p_i \geq 0$

➤  $\sum p_i = 1$

# Probability distribution of discrete random variables

- As an example, if we regard the pips of a dice as a R.V., we have :

R.V. $X$	1	2	3	...	6
Probability $P$	1/6	1/6	1/6	...	1/6

➤  $P(X = x_i) = 1/6$

➤  $p_i \geq 0$

➤  $\sum p_i = 1/6 + 1/6 + \dots + 1/6 = 1$

# Probability distribution of discrete random variables

- If we regard the probability of each number of a R.V. as a function, i.e., we define  $P(X = x_k) = f(x_k)$ , then this function  $f$  is called *discrete probability distribution*.

➤  $f(x_k) \geq 0, \quad k = 1, 2, \dots$

➤  $\sum f(x_k) = 1$

➤  $f$  is called the discrete probability distribution.

# Probability distribution of discrete random variables

- Ex) If we regard the sum of pips of two dices as a R.V., then we have

X	2	3	4	5	6	7	8	9	10	11	12
P		2/36	3/36	4/34	5/36	6/36	5/36	4/36	3/36	2/36	

## 2-2. Continuous R.V. and its distribution

# Probability distribution of discrete random variables

- Continuous R.V. takes continuous values (for instance, time / error in length or weight).
- The probability is define on an interval in its range, by using a certain function  $f(x)$ .

$$P( a \leq X \leq b ) = \int_a^b f(x) dx$$

- This  $f(x)$  is called the *probability density* of  $X$ .
- The probability density has to satisfy

$$f(x) \geq 0, \text{ and }, \int f(x) dx = 1$$

# Probability distribution of discrete random variables

- Ex) Waiting time subject to the exponential distribution.

- The intervals between large disasters;
- The lifetime of a light bulb;
- The intervals between the calls, and so forth.

- Exponential distribution.

- $f(x) = \lambda e^{-\lambda x} \quad (x \geq 0)$

# Cumulative distribution

- The probability that a R.V. takes a value  $x$  or less.

- $F(x) = P(X \leq x)$

- The discrete R.V.

- $F(x) = \sum f(u)$

- The continuous R.V.

- $F(x) = \int f(u) du$

- $F'(x) = f(x)$

## 2-2. Expected value and variance

# Expected value

- The mean of possible values of a R.V, weighted with the probability of each value. It's denoted as  $E(X)$ .
- $E(x)$
- If we regard the pips of a dice as a R.V., its expected value is
  - $E(X) = 1 \cdot (1/6) + \dots + 6 \cdot (1/6) = 3.5$
- Discrete R.V.
  - $E(X) = \sum x \cdot f(x)$
- Continuous R.V.
  - $E(X) = \int x \cdot f(x) dx$

# Example of expected value

## Expected value of lottery

2012年東日本大震災復興支援 グリーンジャンボ宝くじ 当選確率・期待値等										
1ユニット1000万本		1本300円

# Calculation of expected value

- $E(c) = c$
- $E(X + c) = E(X) + c$
- $E(cX) = cE(X)$
- $E(X + Y) = E(X) + E(Y)$  : Addition formula

➤ Now, let us compare the expected values of the pip of a dice and the mean of the pips of two dices.

➤  $E(X) = 3.5$

➤  $E(Y) = E\{(X_1 + X_2) / 2\} = \{E(X_1) + E(X_2)\} / 2 = 3.5$

# Calculation of expected value (simple example)

- Distribution of pips of dice
  - $f(x) = 1/6$ ,  $(x = 1, 2, \dots, 6)$
  - Can be generalized as...
- Suppose there are  $N$  balls numbered from 1 to  $N$ . They are placed in a box.
- Suppose you take out a ball from the box, and repeat such events. Then, consider the distribution of the numbers of balls.
  - $f(x) = 1/N$ ,  $(x = 1, 2, \dots, N)$

# Calculation of expected value (simple example)

R.V. (X)	1	2	3	...	N
P robability	1/N	1/N	1/N	...	1/N

$$\begin{aligned}
 E[X] &= 1 \times \frac{1}{N} + 2 \times \frac{1}{N} + \dots + N \times \frac{1}{N} \\
 &= \frac{1}{N} \times \left\{ 1 + 2 + \dots + N \right\} \\
 &= \frac{1}{N} \times \frac{N(N+1)}{2} \\
 &= \frac{(N+1)}{2}.
 \end{aligned}$$

● Expected value :  $E[X] = 1 \times \frac{1}{N} + 2 \times \frac{1}{N} + \dots + N \times \frac{1}{N} = \sum_{i=1}^N x_i f(x_i) = \frac{N+1}{2}.$

# Variance

- You cannot capture the characteristics of R.V.s. For instance, two R.V.s with different distributions may have the same expected values.
  - Let  $X$  be the pip of a dice, and  $Y$ , the mean of pips of two dices:  $Y = (X_1 + X_2) / 2$ . Here  $X_1$  and  $X_2$  are the pips of a dice.
  - Let us compare the expected values of  $X$  and  $Y$ .
- Variance : the scale of variation of a R.V. around its expected value.

# Variance

- Let us denote the expected value and variance as  $\mu = E(X)$  and  $V(X)$ , respectively.

➤  $V(X) = E\{(X - \mu)^2\}$

- For discrete R.V.s,

➤  $V(X) = \sum (x - \mu)^2 f(x)$

- For continuous R.V.s,

➤  $V(X) = \int (x - \mu)^2 f(x) dx$

The following formula is frequently used.

➤  $V(X) = E(X^2) - \{E(X)\}^2$  (Expected value of  $X^2$ ) - (squared expected value)

# Exercise

- Let us regard the pip of a dice as a random variable  $X$ . Then, find its variance.

## Exercise 【Answer】

- Let us regard the pip of a dice as a random variable  $X$ . Then, find its variance.
- By using the formula we have seen before (for  $N$  in general), if we apply  $N=6$ , we have
- $E[X] = (6+1)/2 = 7/2$ .
- Next, let us consider  $E[X^2]$ .

# Exercise 【Answer】

- Let us regard the pip of a dice as a random variable  $X$ . Then, find its variance.
- Next, let us consider  $E[X^2]$ .

$X^2$	$1^2$	$2^2$	$3^2$	...	$6^2$
Probability	1/6	1/6	1/6	...	1/6

$$\begin{aligned} E[X^2] &= 1^2 \times \frac{1}{6} + 2^2 \times \frac{1}{6} + \dots + 6^2 \times \frac{1}{6} \\ &= (1^2 + 2^2 + \dots + 6^2) \times \frac{1}{6} = \frac{91}{6} \end{aligned}$$

## Exercise 【Answer】

- Let us regard the pip of a dice as a random variable  $X$ . Then, find its variance.
- Then, by using the formula below, we have

$$V[X] = E[X^2] - (E[X])^2 = \frac{91}{6} - \left(\frac{7}{2}\right)^2 = \frac{35}{12}$$

# Calculation of variance

- $V(c) = 0$
- $V(X + c) = V(X)$
- $V(cX) = c^2 V(X)$

# Standard deviation and z-variable

- Standard deviation is the square root of variance.
- It is denoted as  $D[X]$ .

$$D[X] = \sqrt{V[X]}$$

- Normalization of R.V.

$$Z = \frac{(X - E[X])}{D[X]}$$

- Every R.V. can be transformed to another R.V.  $Z$  that satisfies
- $E[Z] = 0$ ,  $V[Z] = 1$
- This  $Z$  is called as **the normalized R.V.**

# Chebyshev inequality

## Chebyshev inequality

- Shows the relationship between the distribution and S.D. It holds for arbitrary random variable as far as its expected value and standard deviation are finite.
- The probability of a set of values of a r.v.  $X$ , that are apart from the expected value by  $n \times \text{S.D.}$ , is less than  $1/n^2$ .
  - $P(|X - \mu| \geq k\sigma) \leq 1/k^2$
  - Here,  $\mu = E(X)$ ,  $\sigma^2 = V(X)$

## Chebyshev inequality

Suppose there are a large amount of sentences, and the mean length of them is 1000 strings, and S.D. is 200.  
Then, we can conclude that the sentences of 600-1400 strings account for at least 75%.

## Chebyshev inequality

Suppose there are a large amount of sentences, and the mean length of them is 1000 strings, and S.D. is 200. Then, we can conclude that the sentences of 600-1400 strings account for at least 75%.

$$P(|X - 1000| \geq 200k) \leq 1/k^2$$

$$P(|X - 1000| \geq 200 \times 2) \leq 1/2^2 = 0.25$$

$$P(X \leq 600 \text{ or } X \geq 1400) \leq 0.25$$

$$\begin{aligned} P(600 < X < 1400) &= 1 - P(X \leq 600 \text{ or } X \geq 1400) \\ &\geq 1 - 0.25 = 0.75 \end{aligned}$$

## Exercise ①

For a certain r.v.  $X$ , let us assume that  $\mu = E[X] = 10$ , and  $V[X] = 3$ . Then, estimate  $P(|X - 10| \geq 2)$  by using the Chebyshev inequality.

## Exercise ①      【 Answers 】

For a certain r.v.  $X$ , let us assume that  $\mu = E[X] = 10$ , and  $V[X] = 3$ . Then, estimate  $P(|X - 10| \geq 2)$  by using the Chebyshev inequality.

$$\triangleright P(|X - 10| \geq 1.732 k) \leq 1 / k^2$$

Take  $k$  so that  $1.732 k = 2$ . Then,  $k = 1.1547$ ,  $k^2 = 4/3$

$$P(|X - 10| \geq 2) \leq 1 / k^2 = \underline{3/4}$$

## Exercise ②

For a certain r.v.  $X$ , let us assume that  $\mu = E[X] = 5000$ ,  
and  $V[X] = 2500$ .

Then, estimate  $P(|X - 5000| < 400)$  by using the  
Chebyshev inequality.

## Exercise ② 【Answer】

For a certain r.v.  $X$ , let us assume that  $\mu = E[X] = 5000$ , and  $V[X] = 2500$ .

Then, estimate  $P(|X - 5000| < 400)$  by using the Chebyshev inequality.

$$\triangleright P(|X - 5000| \geq 50k) \leq 1/k^2$$

Take  $k$  so that  $50k = 400$ , i.e.  $k = 8$ .

$$P(|X - 5000| \geq 400) \leq 1/k^2 = 1/64$$

$$\begin{aligned} P(|X - 5000| < 400) &= 1 - P(|X - 5000| \geq 400) \\ &\geq 1 - 1/64 = \underline{63/64} \end{aligned}$$

## Exercise ③

For a certain r.v.  $X$ , let us assume that  $\mu = E[X] = 0$ ,  
and  $V[X] = 1/5$ .

Then, estimate  $P(|X| < 3/4)$  by using the  
Chebyshev inequality.

## Exercise ③ 【Answer】

For a certain r.v.  $X$ , let us assume that  $\mu = E[X] = 0$ ,  
and  $V[X] = 1/5$ .

Then, estimate  $P(|X| < 3/4)$  by using the  
Chebyshev inequality.

$$\triangleright P(|X - 0| \geq k/4) \leq 1/k^2$$

$$k/4 = 3/4 \quad \text{i.e., } k = 3$$

$$P(|X| \geq 3/4) \leq 1/k^2 = 1/9$$

$$\begin{aligned} P(|X| < 3/4) &= 1 - P(|X| \geq 3/4) \\ &\geq 1 - 1/9 = 8/9. \end{aligned}$$

# Summary

- You studied the discrete and continuous R.V.s.
- You also studied the expected value, variance (S.D.) and their features.

# Summary(Checklist)

- You can state the difference between the discrete and continuous probability distributions?
- You can explain the cumulative distribution?
- Can you state the elementary calculations of expected value and variance of random variables?
- You can make the normalized R.V?

# Homework

Deadline: 6/18 23:59

<http://bit.ly/2Mg1P9w>

① Suppose that there is a coin. Both sides of which appear with the same probability. A figure “1” is printed on one side, and “5” on another side.  
If you toss this coin, find the expected value of the figure. (You may refer to the case of a dice in this material.)

(i) 3

(ii) 4

(iii) 4.5

(iv) 5

② Suppose that there is a coin. Both sides of which appear with the same probability. A figure “1” is printed on one side, and “5” on another side.

If you toss this coin, find the variance of the figure.

(You may use the formula

$$V(X) = E(X^2) - \{E(X)\}^2$$

① 0.5

② 1

③ 1.5

④ 2

③ Suppose you toss three coins, and regard the number of one specific side as a random variable, denoted as  $X$ .

(i.e.,  $X=1, 2$  or  $3$ ).

Then, find the expected value and variance of this  $X$ .

①  $E[X]=3/4, V[X]=9/4$

②  $E[X]= 3/2, V[X]= 3/2$

③  $E[X]= 3/4, V[X]= 9/4$

④  $E[X]= 3/2, V[X]= 3/4$

# Elementary exercise

For those requested students.  
Try until you find correct answers of all questions.

# Q. I\_9\_E-A

Find the mean and variance of the following data.

16	21	8	4	19
----	----	---	---	----

- (i) Mean 12.8, variance 49.23
- (ii) Mean 12.8, variance 42.64
- (iii) Mean 13.6, variance 49.23
- (iv) Mean 13.6, variance 42.64

## Q. I\_9\_E-B

The table below shows the height and weight of 5 students. Then, find the covariance and correlation coefficient

Students	A	B	C	D	E
Height[cm]	160	165	158	172	168
Weight[kg]	60	59	69	67	58

- (i) covariance -2.96, correlation coefficient -0.128
- (ii) covariance -3.96, correlation coefficient -0.528
- (iii) covariance 3.96, correlation coefficient 0.428
- (iv) covariance 2.96, correlation coefficient 0.128
